Concise, informative title in sentence case

A short (2–3 sentence) non-technical summary of the main message of the News & Views piece. This should be accessible to a broad scientific audience and state clearly what the primary paper has shown and why it matters.

The recent work by Primary Author and colleagues [1] reports a notable advance in *[field/topic]*, offering a new perspective on *[key concept or system]*. In this News & Views article, you should briefly set the context, explaining what was known previously and why the new findings are timely or surprising.

Avoid excessive technical detail here; aim for a broad scientific audience. Introduce specialized terms gently, and focus on the conceptual message rather than on experimental minutiae.

Explain succinctly what the primary paper accomplishes. Describe the central result or conceptual step forward, and how it fits into the existing literature. Use superscript citations for key references, for example: the primary paper [1] and relevant background work. [2]

Where helpful, use one or two carefully chosen sentences to describe the methods or experimental/theoretical approach, but do not reproduce the technical description from the original paper.

Discuss qualitatively what the figure illustrates in the text. Figures in News & Views are often interpretative or conceptual rather than raw data.

Provide your expert commentary on how the community should interpret the result. What does it change about our understanding, and what does it not change? Highlight any assumptions, caveats or limitations that the non-specialist reader should keep in mind.

If appropriate, discuss whether there are alternative explanations or remaining controversies, but do so succinctly and constructively.

Conclude with a forward-looking perspective. What new avenues of research does this work open? Are there clear next experiments, theoretical developments or applications that this result makes possible?

End on a concise, high-level statement that captures the broader significance of the work for the field or for neighbouring disciplines.

First A. Author[1] and Second B. Author[2]

[1] Department, Institution, City, Country

[2] Department, Institution, City, Country

Correspondence to: First A. Author (first.author@example.com)
